Software solution

Digital Signage Software meovis

meovis Digital Signage Software

- Completely web-based interface
- Location-independent maintenance via a browser
- Time control of media
- Display of news, information, entertainment and advertising
- Scalable (can be expanded at any time)

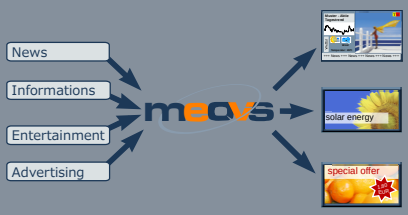

meovis Administration Server software can either be installed together with the Client Player software on a single PC (standalone variant), or operated separately on a server (distributed variant).

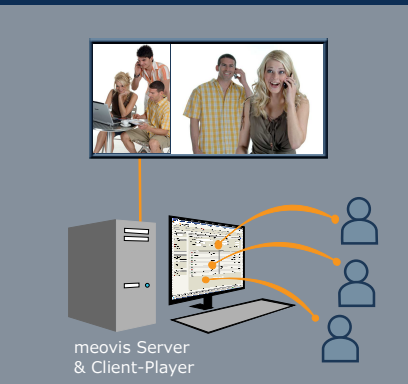

The software is operated exclusively using a browser.
This means that no additional software needs to be installed on the administrators' workstations.

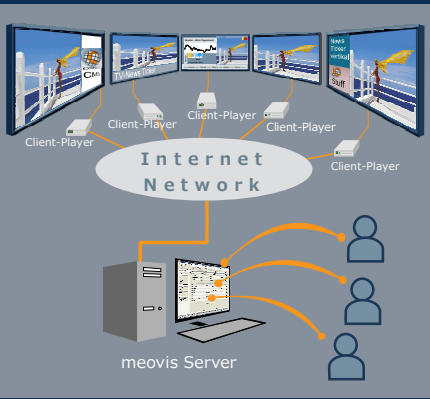

An integrated rights and roles system enables user-specific rights for various areas of administration.

Media are centrally administered via the administration server, and are assigned to the display via the campaign.

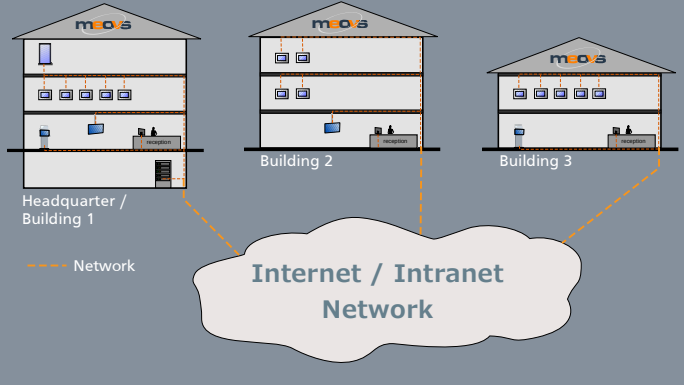

Administration Server

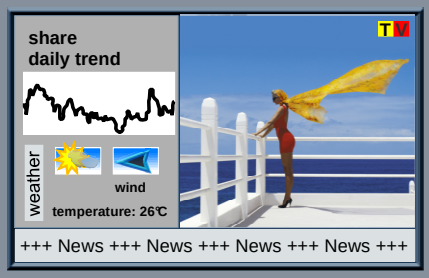

Distributed display solution across multiple buildings

Client-Player Software

A meovis campaign can be divided into many different panels, as required.

Content such as presentations, video films, slide shows, news tickers or offline Flash films / HTML pages and web sites from the Internet / an intranet can be assigned to these panels.

As many displays as required can be actuated via a meovis campagne.

This allows the display campaign to be shown on as many displays as required by means of a single change.

System requirements:
Administration Software Windows, min. 1,8GHz, 60 GB HDD, 2GB RAM

Client-Player Software: Windows, 2 GHz, 80 GB HDD, 2GB RAM
